暂时没有用到，后期用到再补充

以上寄存器讲完，开始代码：

6.程序示例

示例1

开启ADC2，使用AVCC基准源，8倍预分频

```
1 void setup(){
2   Serial.begin(9600); // 设置串口通讯
3
4   // 设置使用AVCC基准电压源；设置测量ADC2；
5   ADMUX = _BV(REFS0) | _BV(MUX1);
6   // ADC使能；设置ADC预分频器为8；
7   ADCSRA = _BV(ADEN) | _BV(ADPS1) | _BV(ADPS0);
8 }
9
10 void loop(){
11   ADCSRA |= _BV(ADSC); // 开始转换
12   Serial.println(ADC);

7.Arduino Nano 内置温度测量 (ADC8)

先上代码

5
6     // 设置使用内置1.1V基准电压源；设置测量ADC8；

8     // ADC使能；设置ADC预分频器为16；
9     ADCSRA = _BV(ADEN) | _BV(ADPS2);
10 }
11
12 void loop(){
13     ADCSRA |= _BV(ADSC); // 开始转换
14
15     T = (ADC-320) / 1.28; // 转化为摄氏度
16
17     Serial.print(T); // 输出ADC值
18     Serial.println(" 摄氏度");
19     delay(100); // 延时100MS
20 }
```

ATMEGA328P温度测量说明

- 该芯片内部温度传感器连接ADC8（未输出引脚）
- 测量温度时需使用内置1.1V基准电压源

The temperature measurement is based on an on-chip temperature sensor that is coupled to a single ended ADC input. MUX[4..0] bits in ADMUX register enables the temperature sensor. The internal 1.1V voltage reference must also be selected for the ADC voltage reference source in the temperature sensor measurement. When the temperature sensor is enabled, the ADC converter can be used in single conversion mode to measure the voltage over the temperature sensor. The measured voltage has a linear relationship to the temperature as described in [Table 23-2 on page 215](#).

- ADC转换温度

Table 23-2. Sensor Output Code versus Temperature (Typical Values)

| Temperature/°C | -40°C | +25°C | +125°C |
|----------------|--------|--------|--------|
| | 0x010D | 0x0160 | 0x01E0 |

具体转化都懂，就不写了

- 另外还提供了校准，但是没有理解，，，有大佬懂的可以解释一下

23.8.1 Manufacturing Calibration

Calibration values determined during test are available in the signature row.
The temperature in degrees celsius can be calculated using the formula:

$$\frac{(((ADCH<<8) + ADCL) - (273 + 100 - TS_OFFSET)) \times 128}{TS_GAIN} + 25$$

- Where:..
- a. ADCH and ADCL are the ADC data registers,
 - b. is the temperature sensor gain
 - c. TS_OFFSET is the temperature sensor offset correction term
TS_GAIN is the unsigned fixed point 8-bit temperature sensor gain factor in 1/128th units stored in the signature row.
TS_OFFSET is the signed twos complement temperature sensor offset reading stored in the signature row. See [Table 26-5 on page 236](#) for signature row parameter address

附通过寄存器地址读取寄存器代码：

```
1 volatile uint8_t *PA=(volatile uint8_t *)0x103;
2
3 void setup(){
4     Serial.begin(9600);
5 }
6
7 void loop(){
8     Serial.println(*PA);
9     delay(1000);
10 }
```
